ABSTRACT

Census Bureau data on educational attainment of the U.S. population are presented for 1982 to 1985, with trend data for 1940 to 1985. A brief narrative summary of the findings is also provided. Detailed tables cover years of school completed by persons 15 years old and over by age, sex, race, Spanish origin, type of residence, region of residence, occupation, marital status, and education of spouse. Summary data also cover the 15 largest states and metropolitan areas. Years of school data were derived by considering the highest grade ever attended and whether the grade was finished. Persons of Spanish origin may be of any race and responses generally refer to a person's perceived national or ethnic lineage (i.e., Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin). Findings include: 36% of the adult population had completed at least 1 year of college and 19% had completed 4 or more years of college in 1985; and there was virtually no difference in the proportion of men and women aged 25 to 29 who were high school graduates. Appendices include definitions and information on the source and reliability of estimates. (SW)

Acknowledgments

This report was prepared in the Education and Social Stratification Branch, under the general direction of **Paul M. Siegel**, Chief. **Brenda R. Jeffries** contributed to table preparation and **Andrea E. Adams** conducted the statistical review of the text. Computer programming was provided by **Thelma N. Varhach**, and survey operations were coordinated by **Kathleen P. Creighton**, Demographic Surveys Division. Sampling review and appendix B were provided by **Lloyd Hicks**, Statistical Methods Division. **Robert Kominski**, Education and Social Stratification Branch, Population Division, and **Suzanne M. Bianchi**, Center for Demographic Studies, reviewed the contents of the report. Overall direction was provided by **Arthur J. Norton**, Assistant Chief, Population Division.

Data collection was conducted by Bureau of the Census interviewers under the overall direction of **Stanley D. Matchett**, Chief, Field Division. Publication planning, design, composition, editorial review, and printing planning and procurement were provided by the staff of Publication Services Division, **Walter C. Odom**, Chief. Publication coordination and editing were performed by **Linda Ambill**.

A. High school and college graduates by region: March 1970 and 1985 3

Figures

1. Years of school completed: 1940 to 1985 4
2a. High school completion of men and women by age: 1940 to 1985 5
2b. High school completion of Whites and Blacks by age: 1940 to 1985 5
3a. College completion of men and women by age: 1940 to 1985 6
3b. College completion of Whites and Blacks by age: 1940 to 1985 6

Detailed Tables

1. Years of school completed by persons 15 years old and over, by age, sex, race, and Spanish origin: March 1985, 1984, 1983, and 1982 7
2. Years of school completed by persons 15 years old and over, by single years of age, sex, race, and Spanish origin: March 1985 19
3. Years of school completed by persons 15 years old and over, by age, sex, race, Spanish origin, and marital status: March 1985 34
4. Years of school completed by all householders and family householders, by age, sex, race, and Spanish origin: March 1985 39
5. Education of husband by education of wife, for married couples, by age of husband: March 1985 41
6. Years of school completed by employed persons 25 to 64 years old, by major occupation group, age, sex, race, and Spanish origin: March 1985 43
7. Years of school completed by persons 15 years old and over, by age, sex, race, Spanish origin, and region: March 1985 48
8. Years of school completed by persons 15 years old and over, by age, sex, race, and Spanish origin, for the 15 largest States: March 1985 51
9. Years of school completed by persons 18 years old and over, by single years of age, sex, race, and Spanish origin: March 1983 53
10. Years of school completed by persons 15 years old and over, by age, sex, race, Spanish origin, and marital status: March 1983 70
11. Years of school completed by all householders and family householders, by age, sex, race, and Spanish origin: March 1983 75
12. Education of husband by education of wife, for married couples, by age of husband: March 1983 77

13. Years of school completed by employed persons 25 to 64 years old, by major occupation group, age, sex, race, and Spanish origin: March 1983 79
14. Years of school completed by persons 18 years old and over, by metropolitan and nonmetropolitan residence, age, race, sex, and Spanish origin: March 1983 83
15. Years of school completed by persons 15 years old and over, by age, sex, race, Spanish origin, and region: March 1983 91
16. Years of school completed by persons 15 years old and over, by age, sex, race, and Spanish origin, for the 15 largest States: March 1983 95
17. Years of school completed by persons 15 years old and over, by age, sex, race, and Spanish origin, for the 15 largest standard metropolitan statistical areas: March 1983 99
18. Years of school completed by persons 25 years old and over, by age and sex: Selected years 1940 to 1985 103
19. Percent of persons 25 years old and over who have completed high school or college, by race and sex: Selected years 1940 to 1985 105
20. Percent of persons 25 years old and over who have completed high school or college, by sex, for the Spanish-origin population: March 1974 to 1985 107

B-10. Factors to be applied to standard errors 123

Educational Attainment in the United States: March 1982 to 1985

This report contains data from the Current Population Survey (CPS) conducted by the Bureau of the Census in March of 1982 to 1985. Summary data on years of school completed by age, sex, race, and Spanish origin are shown for 1982 to 1985 in table 1. Detailed data are shown for 1985 in tables 2 through 8 and for 1983 in tables 9 through 17. This allows for the continuation of the biennial series of detailed tables as presented in previous reports. Tables 18 to 20 contain a time series of the data collected from 1940 to 1985 in the decennial censuses and CPS.

The detailed tables present data on years of school completed by persons 15 years old and over by age, sex, race, Spanish origin, type of residence, region of residence, occupation, marital status, and education of spouse. Also, summary data are presented for the 15 largest States and metropolitan areas.

TRENDS IN EDUCATIONAL ATTAINMENT

Between 1940, when the Bureau of the Census began to collect data on educational attainment, and 1985, there has been a remarkable increase in the proportion of the U.S. population who completed at least 4 years of high school. Figure 1 shows that the proportion of the adult population 25 years old and over who completed high school increased from roughly one-quarter in 1940 to nearly three-quarters in 1985. The proportion who were college graduates also rose considerably during the same period.

While the opportunity to complete high school is now nearly universal, the chance of continuing on through college is not. Nearly half of all high school graduates attend college, but only slightly more than half of those complete 4 years of college. In March 1985 about 74 percent of all adults 25 years old and over were high school graduates (completed 4 years of high school or more), about 36 percent completed at least 1 year of college and 19 percent completed 4 or more years of college. In 1940 about 24 percent were high school graduates and 5 percent had completed 4 or more years of college.

A picture of recent changes in educational attainment can be seen in the experience of young adults, 25 to 29 years old. The proportion of young adults who were high school graduates rose from 38 to 86 percent between 1940 and 1985. The proportion has been at least 75 percent since 1970 and 85 percent since 1977. The proportion of young adults who were college graduates rose from 6 percent in 1940 to 22 percent in 1985.

GENDER DIFFERENCES

By 1980, gender differences in the proportion of the population who completed high school were virtually nonexistent—86 percent of young men (25 to 29 years old) and young women had completed high school. As late as the 1950's, more young women than young men were high school graduates (figure 2a). In the 1970's, the relationship was reversed for a short time, with higher proportions of men than women high school graduates. The higher proportions for men at that time may be attributed to the high proportion of men in that cohort who served in the Armed Forces, which had a pay incentive for high school completion.

For both men and women, the proportions who completed college increased since 1940, but the differences between them also increased (figure 3a). In 1940, young men were more likely than young women to have completed college, but the difference was small (7 percent vs. 5 percent). By the 1950's, the gap had widened to 7 percentage points, and the proportion for men was twice that for women (14 percent vs. 7 percent). Perhaps the combination of the GI Bill for men and the lowered marriage age and increased fertility for women resulted in the increased difference: enrollment of men increased but enrollment of women did not.[1] Although, in the two decades that followed, increased proportions of both men and women completed college, some difference remained—in 1975, 25 percent of young men and 19 percent of young women had completed 4 or more years of college. By 1985, there was a slight decrease in the proportion of young men and an increased proportion of young women who completed college, which resulted in a decrease in the gap between the groups—23 percent of men and 21 percent of women were college graduates. The decline for men can be explained in part by the passing of the "Vietnam cohort" from

[1]U.S. Bureau of the Census, 1940 Census of Population, and Current Population Reports, Series P-20, Nos. 1, 19, 413 (annual school enrollment series).

the 25 to 29 year old age group. This cohort includes men who were of traditional college age and draft-eligible age during the Vietnam period, when the largest proportion of that age group was in the Armed Forces. Some men remained in college longer when college provided a draft deferment; others took advantage of the education benefits of the GI Bill following their military service. While changes in enrollment trends in recent years have reduced the difference in the proportions of young men and young women who are college graduates, a substantial difference remained among all adults 25 years old and over—23 percent of men and 16 percent of women were college graduates in 1985.

RACIAL DIFFERENCES

Racial differences in the ratio of proportions of persons who were high school graduates narrowed considerably between 1940 and 1985. The proportion for Whites 25 years old and over was 1.3 times that for Blacks in 1985, compared with 3.6 times in 1940. About 76 percent of Whites and 60 percent of Blacks were high school graduates in 1985 (figure 2b). In 1940, the proportions were 26 percent and 7 percent. Among young adults 25 to 29 years old, the difference between Whites and Blacks was very small by 1985: 87 percent of White young adults and 81 percent of comparable Blacks were high school graduates in 1985 compared with 41 percent of Whites and 12 percent of Blacks in 1940. In the 45-year period, the proportion of Whites who were high school graduates slightly more than doubled, while the proportion of Blacks with a comparable level of attainment grew to about 7 times its original size.

While progress was made in the proportions of Whites and Blacks who completed high school and college, the difference between the race groups was greater at the college completion level than high school completion level in 1985, as demonstrated by the White to Black ratios. It is much easier for all racial, ethnic, and economic groups to converge at the high school completion level, since all States provide public education through the 12th grade. College, on the other hand, usually entails greater costs in both direct payments and foregone wages. While the ratio of the proportions of Whites to Blacks who completed 4 years of college has decreased (in 1985 Whites were nearly twice as likely as Blacks to have completed college compared with almost 4 times as likely in 1940), the percentage point gap has widened (figure 3b). In 1985, 20 percent of White adults and 11 percent of Blacks were college graduates; 45 years earlier the proportions were 5 percent and 1 percent. For Whites, the proportion of young adults who were college graduates in 1985 was barely different from that for all White adults, while for Blacks the proportions were not significantly different—23 percent of Whites and 12 percent of Blacks. For young Blacks, the proportion grew from about 2 percent in 1940 to about 11 percent in 1975 and has not changed significantly since. Among young Whites, there has been a slight decrease since 1977 when the "Vietnam cohort" was 25 to 29 years old.

REGIONAL DIFFERENCES

Regional differences in the proportions of adults who completed high school and college have remained over time, but the magnitude of the differences changed (table A).The proportion who were high school graduates was highest in the West and lowest in the South in both 1970 and 1985; the difference had declined by 1985, however. Over the period, the proportion grew from 62 percent to 80 percent in the West and from 45 percent to 69 percent in the South. In both years, the proportion who were college graduates was highest in the West, 24 percent in 1985, and lowest in the South and Midwest, 18 percent in 1985; the difference increased since 1970.

In all regions, over 80 percent of young adults were high school graduates in 1985; the proportion was lowest for the South in both 1970 and 1985. Significant changes have occurred in the proportions who were college graduates: whereas, in 1970, no one region stood out from the others in the proportion of young adults who were college graduates, in 1985, the proportion was significantly higher among young adults residing in the Northeast than in other regions—27 percent vs. an average of 21 percent in the other regions. At a time when there was evidence of significant outmigration of young adults from the Northeast,[2] the economic opportunities for college graduates were apparently relatively greater in the Northeast than in other regions. In addition, the higher enrollment rates of the traditional college-age population in the Northeast,[3] provides evidence of greater educational opportunities in the Northeast than in other regions.

[2]Population estimates in table A show the increase for the 25- to 29-year-old age group in the Northeast from 1970 to 1985 was less than half the rate of increase for the rest of the country. See 1980 census data on migration by age in U.S. Bureau of the Census, 1980 Census of Population, PC80-1-D1-B, table 315.

Appendix A. Definitions and Explanations

Population coverage. The figures in this report for March 1982 to March 1985 are sample survey data and relate to the noninstitutional population of the 50 States and the District of Columbia. Members of the Armed Forces living off post or with their families on post are included; all other members of the Armed Forces are excluded. The March 1985 survey included 925,000 members of the Armed Forces, in March 1984 there were 879,000 members, in March 1983, 881,000 members, and in March 1982, 871,000 members.

Population figures shown for States and SMSA's are based on weighted results of the Current Population Survey and have not been adjusted to independent Census Bureau estimates.

The estimation procedure used for this survey involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on civilian noninstitutional population counts from the decennial censuses and are updated with statistics on births, deaths, immigration, and emigration and statistics on the strength of the Armed Forces. Data published in this series for 1972 through 1979 were based on independent population estimates derived by updating the 1970 decennial census counts. Starting with the data collected in March 1980 Current Population Survey (CPS), independent estimates were based on civilian noninstitutional population controls for age, race, and sex established by the 1980 decennial census.

The April 1980 census population count differed somewhat from the independent estimates for April 1980 derived by updating 1970 census population figures. The April 1980 census count of the civilian noninstitutional population was 222,420,441, compared with the 1970 census based figure of 217,400,244 used for the CPS. Basically, this difference had little impact on summary or proportional measures, such as medians and percent distributions; however, use of the new controls could have significant effect on the absolute numbers.

Age. The age classification is based on the age of the person at his last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" is not shown separately.

Spanish origin. Information on origin or descent was obtained by asking "What is (this person's) origin or descent?" Responses generally refer to a person's perceived national or ethnic lineage and do not necessarily indicate the country of birth of himself or his parents.

Persons of Spanish origin are persons who reported themselves as Mexican American, Chicano, Mexican, Mexicano, Puerto Rican, Cuban, Central or South American, or other Spanish origin. Persons of Spanish origin may be of any race.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school he has ever attended?" and (b) "Did he finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the population into two equal parts, one-half having completed more schooling and one-half having completed less schooling than the median. This median was computed after the statistics on years of school completed had been converted to a continuous series of numbers (e.g., completion of the first year of high school was treated as completion of the 9th year and the completion of the first year of college as completion of the 13th year). The persons completing a given school year were assumed to be distributed evenly within the interval from .0 to .9 of the year (for example, persons completing the 12th year were assumed to be distributed evenly between 12.0 and 12.9). In fact, at the time of the March survey, most of the enrolled persons had completed about three-fourths of a school year beyond the highest grade

completed, whereas a large majority of persons who were not enrolled had not attended any part of a grade beyond the highest one completed. The effect of the assumption is to place the median for younger persons slightly below, and for older person's slightly above, the true median. Because of the inexact assumption as to the distribution within an interval, this median is more appropriately used for comparing groups and the same group at different dates than as an absolute measure of educational attainment.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." Only the first is shown separately in this report. A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations and other persons permanently or temporarily separated because of marital discord. The remainder includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married-couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Census Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head."

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family.

Family household. A family household is a household maintained by a family (as defined above). The family householder is the designated householder of such a household. Prior to 1980 this person was referred to as the "family head."

Employed. Employed persons comprise those civilians who, during the survey week, were either (1) "at work"—those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or business; or (2) "with a job but not at work"—those who did not work and were not looking for work but had a job or business from which they were temporarily absent because of vacation, illness, labor-management dispute, bad weather, or because they were taking the week off for various other reasons.

Occupation. Data on occupation are shown for the employed and relate to the job held during the survey week. Persons employed at two jobs or more were reported in the job at which they worked the greatest number of hours during the week. The major groups used here are generally the major groups used in the 1980 Census of Population, Vol. 1, *Characteristics of the Population, U.S. Summary.*

Metropolitan-nonmetropolitan residence. Data for metropolitan and nonmetropolitan areas are available for March 1983 in tables 14 and 17. The Current Population Survey was undergoing a major redesign from April 1984 to June 1985, which affected the estimates of geographic components and, therefore, data for March 1985 have been omitted from this report. The major purpose of the redesign was to make use of data from the 1980 census in order to update the sampling frame, to improve the efficiency and quality of the survey, and to meet the increased need for State data. Technical aspects of the redesign are discussed in appendix B.

SMSA's are defined by the Office of Management and Budget for use in the presentation of statistics by agencies of the Federal Government. Although a change in the criteria for identifying metropolitan areas was implemented in 1983 and the name was changed to Metropolitan Statistical Area (MSA), the change was not implemented in the CPS until after the phase-in of the sample redesign was complete in July 1985. Therefore the metropolitan definition in this report uses the pre-1983 criteria.

The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

The population inside SMSA's is further classified as "in central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

a. The largest city in an SMSA is always a central city.

b. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:

   1. The additional city or cities has at least 250,000 inhabitants.

   2. The additional city or cities has a population of one-third or more of that of the largest city and a minimum population 25,000.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The definition of a farm was changed in the mid-1970's, and the new definition was introduced into this data series beginning with the report for March 1980 and 1981.

According to the current definition, the farm population consists of all persons living in rural territory on places from which $1,000 or more of agricultural products were sold during the preceding 12 months. Rural persons in institutions, motels, and tourist camps are not classified as farm population.

The nonfarm population comprises persons living in urban areas and all rural persons not on farms.

Geographic regions. The four major regions of the United States, for which data are presented in this report, represent groups of States, as follows:

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

Most of the estimates in this report are based on data collected in March 1983 and 1985 from the Current Population Survey (CPS) of the Bureau of the Census. Some estimates are based on data obtained from the CPS in earlier years and from earlier decennial censuses. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, questions are asked each March about educational attainment. In order to obtain more reliable data for the Spanish population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

CPS Design Phase-In. Since the inception of the CPS in 1940, the sample has been redesigned several times to raise the quality and reliability of the data to meet changing data needs. Beginning in April 1984, the old design was phased out through a series of changes that were completed in July 1985. The March 1985 CPS sample consists of three rotation groups from the 1970 census files, four rotation groups from the 1980 census files, and one rotation group from both files. The coverage was in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. Due to the phase-in of the new design, the March 1985 CPS sample had three rotation groups located in 629 sample areas comprising 1,148 counties, independent cities, and minor civil divisions and five rotation groups located in 729 sample areas representing 1,973 counties and equivalent geographic areas in the United States. This current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. In this sample, approximately 59,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The table below provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

CPS Estimation Procedure. The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States

Description of the March Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible[2]	
		Interviewed	Not Interviewed
1985	[3]629/729	57,000	2,500
1982 to 1984	629	58,000	2,500
1980 to 1981	629	65,500	3,000
1977 to 1979	614	55,000	3,000
1973 to 1976	461	46,500	2,500
1972	449	45,000	2,000
1967 to 1971	449	48,000	2,000
1963 to 1966	357	33,500	1,500
1960 to 1962	[4]333	33,500	1,500
1957 to 1959	330	33,500	1,500
1954 to 1956	230	21,000	500 - 1,000
1947 to 1953	68	21,000	500 - 1,000

[1] These sample areas were chosen to provide coverage in each State and the District of Columbia.
[2] Does not include supplemental Spanish households.
[3] Three rotation groups were located in 629 areas and five rotation groups in 729 areas.
[4] Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

by age, race, sex, and Hispanic/non-Hispanic categories. These independent estimates are based on statistics from the decennial censuses of population; statistics in births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. The independent population estimates used to obtain data for 1980 and later are based on the 1980 decennial census. In earlier reports in this series, data for 1972 through 1979 were obtained using independent population estimates based on the 1970 Decennial Census. For more details on this change, see appendix A, "Population coverage." The estimation procedure for the data from the March supplement involved a further adjustment so that husband and wife of a household received the same weight.

The estimates in this report for the survey year 1985 are also based on revised survey weighting procedures for persons of Spanish origin. In previous years, the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Spanish-origin population. During the last several years, the Bureau of the Census has developed independent population controls for the Hispanic population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all, illegal immigrants.

RELIABILITY OF THE ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the estimate and the desired value.)

Nonsampling Variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of respondents to provide correct information, inability to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the 1980 Decennial Census, is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race-Hispanic population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling Variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average results of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypotheses appearing in this report is that the population parameters are identical, and (2) the population parameters are different. An example of this would be comparing the proportion of young men who are college graduates to young women. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. Let the standard error on the difference x-y be S_{DIFF}. If the ratio $R = (x-y)/S_{DIFF}$ is between -2 and +2, no conclusion about the characteristics is justified at the 0.05 level of significance. If, on the other hand, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the characteristics are different. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 5-percent chance of concluding that they are different. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between characteristics is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between characteristics is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison is qualified by the use of the phrase "some evidence."

Comparability of Data. Caution should be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to those for 1972 through 1979, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

Care must also be taken when comparing Spanish-origin estimates over time due to the recent change in weighting of the Spanish-origin population beginning in 1985. Before 1985, there were no independent population control totals for persons of Spanish origin. See the section entitled "CPS Estimation Procedure."

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of the "householder" concept instead of the traditional "head" concept and the introduction of the new farm definition. Due to these and other changes, caution should be used in comparing estimates for 1980 through 1985 with estimates for earlier years. A description of these changes is given in appendix A, "Householder" and "Farm-nonfarm residence."

Another major change is the phase-out of the 629 sampling areas obtained by sampling from 1970 census materials and using the 729 sampling areas obtained by sampling from 1980 census materials. The current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined.

Also, in using metropolitan and nonmetropolitan data, caution should be used in comparing estimates for 1977 and 1978 to each other or to any other years. Methodological and sample design changes occurred in these years resulting in relatively large differences in the metropolitan and nonmetropolitan area estimates. However, estimates for 1979 and later are comparable as are estimates for 1976 and earlier. Data on metropolitan and nonmetropolitan residence are not available for 1985. See appendix A.

Decennial Census of Population. The decennial censuses data shown in this report are not strictly comparable to the CPS data. This is due in a large part to differences in interviewer training and experience and in different survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Note When Using Small Estimates. Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs. Also, care must be taken in the interpretation of small differences.

For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard Error Tables and Their Use. In order to derive standard errors that would be applicable to a larger number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables B-1 through B-8 are approximations to the standard errors of various estimates for persons in the United States. To obtain the approximate standard error for a specific characteristic, the appropriate standard error in tables B-1 through B-8 must be multiplied by the factor for that characteristic given in table B-9. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-9. The two parameters may be used directly to calculate the standard errors for estimated numbers and percentages. Methods for computation are given in the following sections.

Standard Errors of Estimated Numbers. The approximate standard error, S_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$S_x = f_1 f_2 s \qquad (1)$$

where f_1 is the appropriate factor from table B-9, f_2 is the appropriate factor from table B-10, and s is the standard error of the estimate obtained by interpolation from tables B-1, B-2, B-3, or B-4.

Alternatively, the standard error for estimates may be calculated directly using the parameters in table B-9. For

Table B-1: Generalized Standard Errors for Estimated Numbers of Persons for Education Characteristics: Total or White

(Numbers in thousands)

Estimated number of persons	Total persons in age group[1]									
	100	250	500	1,000	2,500	5,000	10,000	25,000	50,000	100,000

100	-	12.5	14.4	15.3	15.8	16.0	16.0
200	-	10.2	17.7	20.4	21.9	22.3	22.6
300	-	-	17.7	23.4	26.2	27.1	27.5
400	-	-	14.4	25.0	29.6	30.9	31.6
500	-	-	-	25.5	32.2	34.2	35.1
750	-	-	-	22.1	36.9	40.7	42.5
1,000	-	-	-	-	39.5	45.6	48.4
2,000	-	-	-	-	32.2	55.9	64.5
3,000	-	-	-	-	-	55.9	73.9
4,000	-	-	-	-	-	45.6	79.0
5,000	-	-	-	-	-	-	80.6
7,500	-	-	-	-	-	-	69.8
10,000	-	-	-	-	-	-	-

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard errors for years prior to 1956, multiply the above standard errors by 1.4; for years 1956 to 1966, multiply by 1.14; and for years 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{-(b/T)x^2 + bx}$, where b = 2600 (from table B-9) and T is the total number of persons in an age group.

Table B-3: Generalized Standard Errors for Estimated Numbers of Persons for All Characteristics Other Than Education: Total or White

(Numbers in thousands)

Size of estimate	Standard error[1]	Size of estimate	Standard error[1]
25	11	2,500	105
50	15	5,000	149
100	21	10,000	209
250	33	25,000	323
500	47	50,000	440
1,000	67	100,000	572

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard error for years prior to 1956, multiply the above standard error by 1.4; for 1956 to 1966, multiply by 1.14; and for 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{ax^2 + bx}$, where a = -0.000012 and b = 4480 from table B-9.

Table B-4: Generalized Standard Errors for Estimated Numbers of Persons for All Characteristics Other Than Education: Black and Other Races

(Numbers in thousands)

Size of estimate	Standard error[1]	Size of estimate	Standard error[1]
25	13	2,500	119
50	18	5,000	156
100	25	10,000	182
250	40	15,000	163
500	56	20,000	64
1,000	78	25,000	-

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard error for years prior to 1956, multiply the above standard error by 1.14; for 1956 to 1966, multiply by 1.14; and for 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{ax^2 + bx}$, where a = -0.000311 and b = 6426 from table B-9.

Table B-5: Generalized Standard Errors of Estimated Percentages for Education Characteristics: Total or White

Base of percentage (thousands)	Estimated percentage[1]					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	1.7	2.5	3.8	5.3	7.6	8.8
100	1.5	2.1	3.3	4.6	6.6	7.6
250	1.0	1.3	2.1	2.9	4.2	4.8
500	0.7	1.0	1.5	2.0	2.9	3.4
750	0.6	0.8	1.2	1.7	2.4	2.8
1,000	0.5	0.7	1.0	1.4	2.1	2.4
2,500	0.3	0.4	0.7	0.9	1.3	1.5
5,000	0.2	0.3	0.5	0.6	0.9	1.1
7,500	0.2	0.2	0.4	0.5	0.8	0.9
10,000	0.2	0.2	0.3	0.5	0.7	0.8
15,000	0.12	0.2	0.3	0.4	0.5	0.6
25,000	0.10	0.13	0.2	0.3	0.4	0.5
50,000	0.07	0.10	0.15	0.2	0.3	0.3
100,000	0.05	0.07	0.10	0.14	0.2	0.2

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard errors for years prior to 1956, multiply the above standard errors by 1.4; for years 1956 to 1966, multiply by 1.14; and for years 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{(b/x)\, p(100 - p)}$, where b = 2312 from table B-9.

all demographic characteristics other than education, use formula (2),

$$S_x = f_2 \sqrt{ax^2 + bx} \qquad (2)$$

where x is the size of the estimate, a and b are the parameters in table B-9 associated with the particular characteristic, and f_2 is the appropriate factor from table B-10. Standard errors for estimates of characteristics pertaining to education may be approximated by formula (3),

$$S_x = f_2 \sqrt{-\left(\frac{b}{T}\right) x^2 + bx} \qquad (3)$$

where x is the size of the estimate, T is the total number of persons in the specific age group, b is the parameter in table B-9 associated with the particular characteristic, and f_2 is the appropriate factor from table B-10.

Illustrations of the Computation of the Standard Error of an Estimated Number. Table 1 of this report shows that in 1985 there were 4,681,000 young adults (ages 25-29 years) who were college graduates and 21,106,000 total persons in that age group. Using formula (1) with f_1 = 1.0 from table B-9, f_2 = 1.0 from table B-10, and s = 89,000 from table B-1, the standard error of 4,681,000 is (1.0) (1.0) (89,000) = 89,000. The value of s (= 89,000) was obtained by linear interpolation in two directions in table B-1. The first interpolation was between 10,000,000 and 25,000,000 total persons for both 4,000,000 and 5,000,000 estimated number of persons. The second interpolation was between these two values to get the value corresponding to 4,681,000 persons. Alternatively, using formula (3), since education is the characteristic of interest, with the appropriate b parameter of 2312 from table B-9 and f_2 factor of 1.0 from table B-10, the approximate standard error is

$$92{,}000 = (1.0)\sqrt{-\left(\frac{2312}{21{,}106{,}000}\right)(4{,}681{,}000)^2 + (2{,}312)(4{,}681{,}000)}$$

The 90-percent confidence interval for this estimate is from 4,534,000 to 4,828,000 (using 1.6 times the standard error). Similarly, the 95-percent confidence interval is from 4,497,000 to 4,865,000 (using twice the standard error). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Table 6 shows that there were 7,218,000 males in executive, administrative, and managerial occupations. Using formula (1) with f_1 = 0.7 from table B-9, f_2 = 1.0 from table B-10, and s = 176 from table B-3, the standard error of 7,218,000 is (0.7) (1.0) (176,000) = 123,000. Alternatively, using formula (2) with the appropriate a parameter of -0.000025 and b parameter of 2013 from table B-9, the approximate standard error is

$$115{,}000 = \sqrt{(-0.000025)(7{,}218{,}000)^2 + (2013)(7{,}218{,}000)}$$

The 90-percent confidence interval for this estimate is from 7,034,000 to 7,402,000, and the 95-percent confidence interval is from 6,988,000 to 7,448,000.

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentage, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter from table B-9 indicated by the numerator. The approximate standard error, $S_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$S_{(x,p)} = f_1 f_2 s \qquad (4)$$

In this formula, f_1 is the appropriate factor from table B-9, f_2 is the appropriate factor from table B-10, and s is the standard error of the estimate from table B-5, B-6, B-7, or B-8. For estimates pertaining to educational characteristics of persons, use table B-5 or B-6; for any other characteristic use table B-7 or B-8. Alternatively, the standard error may be approximated by the following formula from which the standard errors in tables B-5 through B-8 were calculated. Use of this formula will give more accurate results than use of formula (4) above.

$$S_{(x,p)} = f_2 \sqrt{\frac{b}{x} \cdot p(100-p)} \qquad (5)$$

Here x is the size of the subclass of persons or households which is the base of the percentage, p is the percentage ($0 < p < 100$), and b is the parameter in table B-9 associated with the particular characteristic in the numerator of the percentage.

Illustration of the Computation of the Standard Error of an Estimated Percentage. Table 19 shows that an estimated 80.6 percent of the 2,617,000 Black persons aged 25 to 29 years were high school graduates in 1985. Using formula (4) with f_1 = 1.0 and f_2 = 1.0 from tables B-9 and B-10, respectively, and s = 1.3 from table B-6, the standard error of 80.6 percent is

Table B-6: Generalized Standard Errors of Estimated Percentages for Education Characteristics: Black and Other Races

Base of percentage (thousands)	Estimated percentage[1]					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
25	3.2	4.5	7.0	9.7	14.0	16.1
50	2.3	3.2	5.0	6.8	9.9	11.4
75	1.9	2.6	4.1	5.6	8.1	9.3
100	1.6	2.3	3.5	4.8	7.0	8.1
250	1.0	1.4	2.2	3.1	4.4	5.1
500	0.7	1.0	1.6	2.2	3.1	3.6
750	0.6	0.8	1.3	1.8	2.5	2.9
1,000	0.5	0.7	1.1	1.5	2.2	2.5
2,500	0.3	0.5	0.7	1.0	1.4	1.6
5,000	0.2	0.3	0.5	0.7	1.0	1.1
7,500	0.2	0.3	0.4	0.6	0.8	0.9
10,000	0.2	0.2	0.4	0.5	0.7	0.8
15,000	0.13	0.2	0.3	0.4	0.6	0.7
20,000	0.11	0.2	0.2	0.3	0.5	0.6

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard errors for years prior to 1956, multiply the above standard errors by 1.4; for years 1956 to 1966, multiply by 1.14; and for years 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{(b/x)\ p(100 - p)}$, where b = 2600 from table B-9.

Table B-7: Generalized Standard Errors of Estimated Percentages for All Characteristics Other Than Education: Total or White

Base of percentage (thousands)	Estimated percentage[1]					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.4	3.4	5.3	7.3	10.6	12.2
100	2.1	3.0	4.6	6.3	9.2	10.6

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard errors for years prior to 1956, multiply the above standard errors by 1.4; for years 1956 to 1966, multiply by 1.14; and for years 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{(b/x)\ p(100 - p)}$, where b = 4480 from table B-9.

Table B-8: Generalized Standard Errors of Estimated Percentages for All Characteristics Other Than Education: Black and Other Races

Base of percentage (thousands)	Estimated percentage[1]					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
25	5.0	7.1	11.0	15.2	22.0	25.3
50	3.6	5.0	7.8	10.8	15.5	17.9
75	2.9	4.1	6.4	8.8	12.7	14.6
100	2.5	3.5	5.5	7.6	11.0	12.7
250	1.6	2.2	3.5	4.8	6.9	8.0
500	1.1	1.6	2.5	3.4	4.9	5.7
750	0.9	1.3	2.0	2.8	4.0	4.6
1,000	0.8	1.1	1.7	2.4	3.5	4.0
2,500	0.5	0.7	1.1	1.5	2.2	2.5
5,000	0.4	0.5	0.8	1.1	1.6	1.8
7,500	0.3	0.4	0.6	0.9	1.3	1.5
10,000	0.3	0.4	0.6	0.8	1.1	1.3
15,000	0.2	0.3	0.5	0.6	0.9	1.0
20,000	0.2	0.3	0.4	0.5	0.8	0.9

[1]These values must be multiplied by the appropriate "f" factor in tables B-9 and/or B-10 to obtain the standard error for a specific characteristic.

NOTE: (i) To estimate the standard errors for years prior to 1956, multiply the above standard errors by 1.4; for years 1956 to 1966, multiply by 1.14; and for years 1967 to 1979, multiply by 0.93.

(ii) The standard errors were calculated using the formula, $\sqrt{(b/x)\, p(100 - p)}$, where b = 6426 from table B-9.

(1.0) (1.0) (1.3) = 1.3. Alternatively, using formula (5) with the appropriate b parameter of 2600 from table B-9,the standard error of 80.6 percent is given by

$$1.2 = (1.0)\sqrt{\frac{2600}{2{,}617{,}000}\,(80.6)\,(19.4)}$$

Thus, a 90-percent confidence interval of this estimate, using the standard error found by formula (4), is from 78.7 to 82.5, and the 95-percent confidence interval is from 78.2 to 83.0.

Standard Error of a Difference. For a difference between two sample estimates, the standard error is approximately equal to

$$S_{(x,y)} = \sqrt{S_x^2 + S_x^2} \qquad (6)$$

where S_x and S_y are the standard errors of the estimates x and y, respectively. The estimates can be numbers, percents, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristics in two different areas or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the Calculation of the Standard Error of a Difference. Table 2 of this report shows that in 1985 an estimated 87.3 percent of 8,926,000 White women 25 to 29 years old were high school graduates as compared to 80.4 percent of 1,419,000 Black women 25 to 29 years old. Using formula (5) with the appropriate b parameter of 2312 from table B-9, the approximate standard error of 87.3 percent is 0.5; with the appropriate b parameter of 2600 from table B-9 the approximate standard error of 80.4 percent is 1.7. The apparent difference between these two estimates is 6.9 percent, and the standard error associated with the difference is:

$$1.8 = \sqrt{(0.5)^2 + (1.7)^2}$$

The 90-percent confidence interval of the difference of 6.9 percent is from 4.0 to 9.8 percent. Similarly, the 95-percent confidence interval is from 3.3 to 10.5 percent. Therefore, a conclusion that the average estimate of the difference derived from all possible samples lies within a range computed in this way would be correct roughly 95 percent of the time. Since this interval does not contain zero, we can conclude with 95-percent confidence that White females age 25 to 29 have a greater percentage of high school graduates than Black females of the same age group.

Standard Error of a Median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits and hence the standard error of a median based on sample data.

Table B-9. "a" and "b" Parameters and "f" Factors for Calculating Approximate Standard Errors of Estimated Numbers and Percentages

Type of characteristic	Parameters[1]		
	a	b	f_1 factor[2]

Total or White	-0.000019	1725	0.6
Black	-0.000164	1725	0.5
Spanish origin	-0.000213	1241	0.4

[1] Multiply parameters by 1.96 for CPS data collected before 1956, by 1.3 for CPS data between 1956 and 1966, and by 0.87 for CPS data between 1967 and 1979.

[2] These factors are to be applied when standard error calculations are made using formulas (1) and (4) only.

Note: For nonmetropolitan data cross-tabulated with other data, also apply the factor 1.2 to the "f_1" factor and the factor 1.5 to the "a" and "b" parameters.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.

2. Add to and subtract from 50 percent the standard error determined in step (1);

3. Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values from the distribution corresponding to the two points established in step (2);

4. Once the limits of the 68-percent confidence interval are computed, the standard error of a median can be computed by the formula

$$S_{median} = (U - L)/2$$

where U = Upper limit of the 68-percent confidence interval,

L = Lower limit of the 68-percent confidence interval.

For calculations of the confidence interval in step (3) use linear interpolation. A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

The formula used to implement step (3) for linear interpolation is:

$$X_{pN} = \frac{pN - N_1}{N_2 - N_1}(A_2 - A_1) + A_1$$

where N = total number of households, families, or persons in the distribution.

X_{pN} = estimated value (e.g., years of school completed) for which the number pN (0 < p < 1) of households, families, or persons in the distribution have larger or equal values. For the purposes of calculating the confidence interval, p takes on the values in step (2). Note that X_{pN} estimates the median when p = 0.50 is used in the formula,

A_1 and A_2 = the estimated values which the upper and lower bounds, respectively, on the interval in which X_{pN} falls (note that A_1 is the larger value),

N_1 and N_2 = the estimated number of households, families, or persons with values at least A_1 and A_2, respectively (note that N_1 is the smaller number here).

This procedure is needed only for determining standard errors for medians obtained by combining published distributions. The procedure can also be used to estimate standard errors for quintiles or other percentiles by distributing the proper percentage value for p and following the steps outlined above. Note that when combining distributions, the resulting median or percentile may lie in an open-ended interval.

Illustration of the Computation of a Confidence Interval and Standard Error for a Median. Table 1 of this report shows that in 1985 the median years of school completed by all persons 25 to 29 years old was 12.9. Table 1 also indicates the base of the distribution from which this median was determined is 21,106,000 persons.

1. Using formula (4) with the appropriate b parameter from table B-9, the standard error of 50 percent on a base of 21,106,000 is 0.5 percentage points.

2. To obtain a 68-percent confidence interval on the estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percent limits of 49.5 and 50.5.

3. From table 1, in 1985, 13.8 percent of all persons aged 25 to 29 years had completed less than 12 years of school and 56.2 percent had completed less than 13 years of school. Using formula (8), the lower limit of the estimate is found to be about

$$\frac{49.5 - 13.8}{56.2 - 13.8} \times (13.0 - 12.0) + 12.0 = 12.84$$

Similarly, the upper limit is found by linear interpolation to be about

$$\frac{50.5 - 13.8}{56.2 - 13.8} \times (13.0 - 12.0) + 12.0 = 12.87$$

Thus, an approximate 68-percent confidence interval for the median school years completed by all persons 25 to 29 years old is from 12.84 to 12.87.

4. The standard error of the median is, therefore, (12.87 - 12.84)/2, or 0.015. (NOTE: Published medians and their standard errors are calculated by the same method as above. However, different medians and standard errors may be obtained because of rounding off errors.)

Table B-10. Factors to be Applied to Standard Errors[1]

Type of characteristic	f_2 factor
U.S. Totals	1.0
States:	
California	0.7
Florida	1.1
Georgia	1.1
Illinois	1.1
Indiana	1.0
Massachusetts	0.9
Michigan	1.1
Missouri	1.1
New Jersey	1.0
New York	1.0
North Carolina	1.1
Ohio	1.1
Pennsylvania	1.1
Texas	1.2
Virginia	1.3
Regions:	
Northeast	0.8
Midwest	0.9
South	1.0
West	0.9
SMSA's (except Washington, D.C.)	1.1
Washington, DC - MD - VA	1.0

[1] Apply these factors to standard errors obtained using either tables B-1 through B-8 or the "a" and "b" parameters in table B-9.
